SUMMARY

I build AI products end to end: I define the product, design the experience, direct development with AI agents (Claude Code) and verify every delivery with automated tests and real screenshots. I have four products of my own, from a desktop app in beta to a web app that is live and in daily use. First-year student of the BSc in AI and Data Science, looking for a remote role in AI product, automation or creative technology.

PROJECTS

Cathedra, AI study app for Windows
Beta with Windows installer · 2026 · Python, JavaScript, Three.js, embeddings · cathedra-beta.vercel.app

- Built a desktop app that transcribes recorded lectures of up to 4 hours with anti-hallucination checks, sorts every material into content, exam, practical work or course logistics and builds a single study plan per subject.
- Every answer cites the lecture, the minute and who said it; anything missing from the material is flagged as absent. On that base it generates study guides, exams calibrated on past midterms, spaced-repetition flashcards, a Feynman mode and a gap analysis against the official syllabus.
- Implemented a four-layer local engine (language, rules, embedding retrieval, symbolic math) so it works offline, and added voice, audio summaries, a graphing calculator, 3D concept scenes and Telegram reminders. More than 6,000 automated tests back it.

Fortal, training web app for iPhone
Live and in daily use · 2026 · React, TypeScript, Three.js, PWA, IndexedDB, Web Push · case study

- Designed and built an installable PWA that plans the day's workout around the equipment and time actually available, and computes loads that can really be set up (plates per side, dumbbell dial).
- Integrated a 3D body model with 20 muscle regions that highlights what is trained today and how each muscle recovers. It logs sets, records and meals offline and sends notifications.
- Verified it with 746 automated tests (unit and end to end) and screenshots at iPhone resolution.

AthleteIQ, AI assistant for sports team staff
Working demo · 2026 · JavaScript, Three.js, Telegram API, conversational AI · case study

- Developed AI Telegram bots: coaching staff ask by chat, voice note or photo and get an answer grounded in squad data (injury risk, load, recovery) in their own language.
- Designed and wrote the landing page in 5 languages, with an interactive 3D ball in Three.js and a chat demo.

coro, review analysis that finds the recurring defect
Prototype · 2026 · Node.js, ES modules, language model, HTML reports · case study

- Automated the reading of public reviews for a product (400 in the largest real run; load test with 1,200): it groups complaints by topic and ranks them by how many negative reviews mention them, severity and whether they are growing.
- It looks for a competitor that already solved the defect and cites the source; if there is no evidence, it says so. It delivers a report with a verdict, verbatim quotes and root-cause hypotheses.

Two-sided marketplace, for a client
MVP in production · Next.js, Postgres

- Worked on an MVP in production with authentication, messaging between both sides and contracts: a Postgres database with 27 migrations and more than 20 routes on real data.

EDUCATION

BSc in Artificial Intelligence and Data Science, UADE, Buenos Aires (August 2026 to present, first year)

AI Hackathon, UADE 2026: fraud-detection agent, graded 10/10

Logistic regression with leave-one-out validation and expected-cost decisions: 83.3% accuracy against 33.3% and 66.7% for the baselines.

Business studies, San Ignacio University, Miami (2026)

SKILLS

Process automation: workflow automation, scheduled jobs (cron), batch processing, API integration, Python scripting, automated release publishing, Windows installers (Inno Setup).

Bots: Telegram bots, AI chatbots, proactive bots and reminders, push notifications (Web Push), voice note transcription, Google Apps Script, deduplication and caching, rate limiting.

Applied AI: large language models (LLM), retrieval-augmented generation (RAG) with citations, embeddings and semantic search, speech-to-text, text-to-speech (TTS), offline local models, hallucination control, model evaluation, prompt engineering.

Security and risk analysis: application security review, threat modeling, path traversal and SSRF prevention, Content Security Policy (CSP), password hashing (scrypt), data encryption, WebAuthn, secret detection, data privacy.

Design and 3D: UX/UI, brand identity, Blender (Cycles rendering), PBR materials, Three.js and WebGL, shaders, motion design (GSAP), typography, accessibility (WCAG), AI image and video generation.

Web and apps: JavaScript, TypeScript, React, Next.js, Node.js, PWA (offline-first), HTML and CSS, desktop apps (WebView2), internationalization (i18n), deployment on serverless platforms.

Data: Python, SQL and PostgreSQL, database migrations, logistic regression, cross-validation (leave-one-out), backtesting, statistical analysis, HTML reports, symbolic algebra (SymPy).

Product and method: product definition, AI-assisted development (Claude Code), AI agent orchestration, roadmap and backlog, acceptance criteria, code review, automated testing (unit and end to end), performance measurement, unit economics and pricing.

LANGUAGES

Spanish: native · English: fluent (Duolingo English Test, B2)
